

The industry filing states that there is sufficient filtering to eliminate BPL interference to all except mobile stations.

Since 80% of public safety users are mobile, this is not sufficient. Industry must assure 100% of all users, mobile included are protected from their interference.

Since they can't the FCC must find that BPL is invalid.

Additional reasons for finding include:

- 1) BPL over telephone lines is also being discussed
- 2) cable, DSL, and satellite internet is available, making BPL unnecessary
